Main Plant Process Building Ventilation

Scott Anderson
Deputy General Manager

Citizen Task Force Meeting
September 27, 2017

Main Plant Ventilation

- All air discharged from the Main Plant Process Building (MPPB) passes through High-Efficiency Particulate Air (HEPA) filters that are tested annually to ensure 99.95% efficiency and each discharge point is equipped with a sampler to monitor emissions.
- Last year, we discharged less than 1% of the allowable radiological emissions and none of the planned changes will affect that rate.
- As the decontamination effort progresses, less airflow is required to maintain the plant, but all ventilation will continue to be filtered and monitored as we always have.
- A phased approach to shutting down the ventilation is being utilized. This approach has been discussed with the DOE, NYSERDA, EPA and the DEC.
